WORLD Meningitis DAY
DEFEAT Meningitis

PREVENTION IS KEY
Vaccines are the most effective method of prevention.

DISEASE SURVEILLANCE
Weak systems delay outbreak detection.
Better disease surveillance would inform more effective treatment programs and also show the true human cost of the disease.

AFTERCARE FOR EVERYONE
Meningitis can have a life-changing and permanent impact.

LEARN THE SYMPTOMS
In many countries, support services don’t meet the needs of their people. We can all help to build more inclusive and accessible societies.

ADVOCACY IS POWERFUL
Patient advocacy groups do important work to provide people affected by meningitis with the support they need.

REMEMBER:
Meningitis is fast to develop, hard to detect and can affect anyone.
